

## Review of reactions:

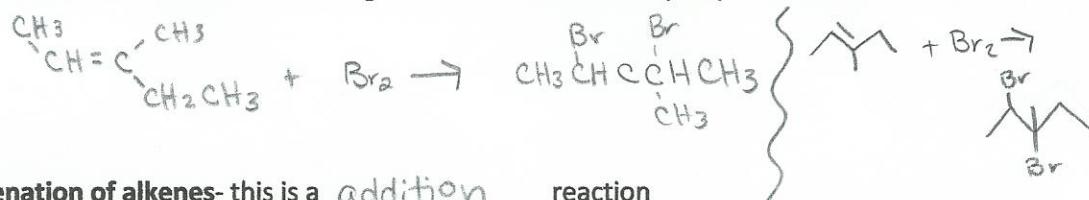

1. **Halogenation of alkanes**- this is a substitution reaction

- a. Write the reaction for the halogenation of propane.

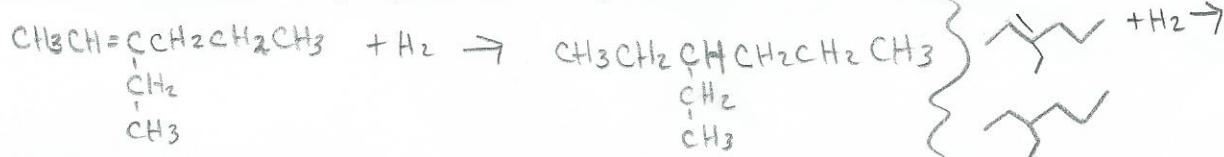

2. **Halogenation of alkenes**- this is a addition reaction

- a. Write the reaction for the halogenation of *trans*-3-methyl-2-pentene with bromine.

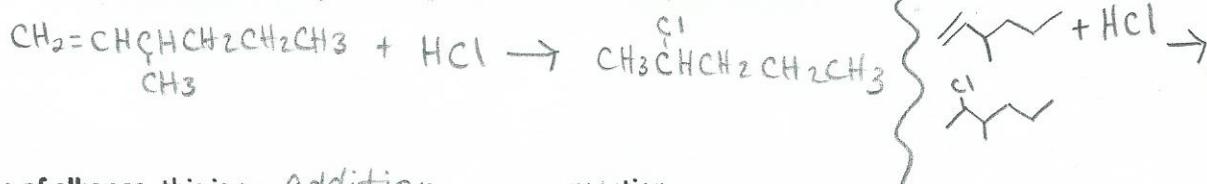

3. **Hydrogenation of alkenes**- this is a addition reaction

- a. Write the reaction for the hydrogenation of 3-ethyl-2-hexene.

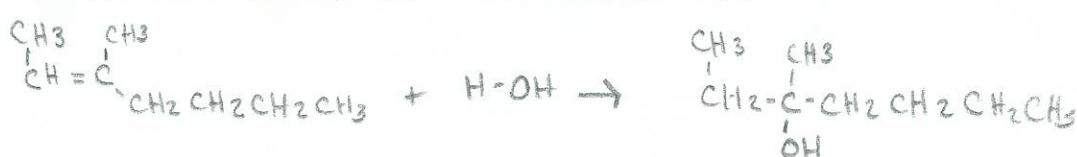

4. **Hydrohalogenation of alkenes**- this is a addition reaction

- a. Write the reaction for the hydrohalogenation for 3-methyl-1-hexene.

5. **Hydration of alkenes**- this is a addition reaction

- a. Write the reaction for the hydration of *trans*- 3-methyl-2-heptene

6. What is Markovnikov's Rule?

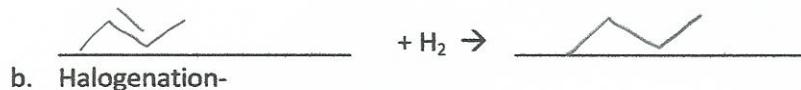

for the addition of H-X or H-OH across a double bond the carbon (involved in the double bond) that has the most directly attached hydrogens gets the H.

7. Review of molecular formulas:

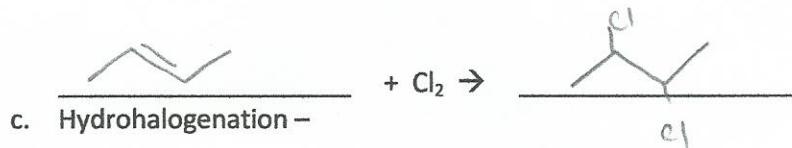

- a. Alkanes  $\text{C}_n\text{H}_{2n+2}$
- b. Cycloalkanes  $\text{C}_n\text{H}_{2n}$
- c. Alkenes  $\text{C}_n\text{H}_{2n}$
- d. Cycloalkenes  $\text{C}_n\text{H}_{2n-2}$

8. The following reactions all start from the same molecule, **2-butene**. 1) Draw this molecule, then  
2) perform the following reactions on it

a. Hydrogenation-

b. Halogenation-

c. Hydrohalogenation -
